

The new UKB hard top jaw system*

Yes. Yet another innovation from FORKARDT!

FORKARDT once again has advanced gripping technology with a completely new design of hard top jaws. From a synthesis of conventional hard jaws and special insert jaws, the new Universal Insert Jaw System has been conceived. This new system combines all the advantages of both conventional jaw types, in a single new, better and cheaper system.

*Patent pending

The Problems:

So often hard jaws do not transmit the necessary clamping forces needed. Conventional hard insert jaws, on the other hand, sometimes leave significant unwanted marks on workpieces.

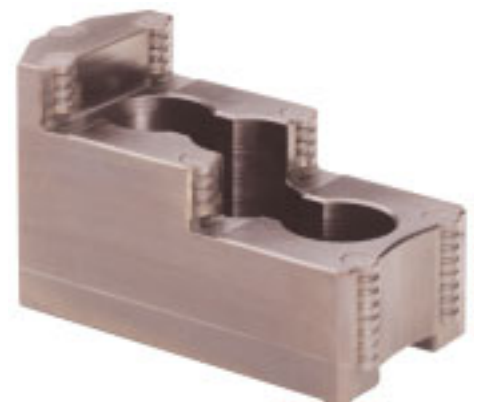

The FORKARDT Solution:

The new UKB Universal Insert Jaw System is quite simply a hard jaw body with very special inserts securely embedded. Simple but effective. UKB jaws are suitable for a wide range of applications, combining the advantages of conventional types of hard jaws.

Your advantages of the new UKB-Jaw-System from FORKARDT:

- 30 % greater gripping torque compared to ordinary hard jaws.
- Reduced wear and extended life due to substantially increased hardness.
- Universal mounting for all common power chucks (e.g. thus replacing conventional HB hard jaws)
- Multiple re-grinding of worn jaws without loss of surface hardness.
- Combining the advantages of hard jaws and insert jaws into one unique design.
- In summary: Better load transmission, reduced wear, and less expensive! All giving you higher productivity -

As usual only from FORKARDT!
